

Correction du TP11

**Sommes doubles****Exercice 1** 1.

$$\begin{aligned}
\sum_{1 \leq i < j \leq n} ij &= \sum_{j=1}^n \left( \sum_{i=1}^j ij \right) = \sum_{j=1}^n \left( j \sum_{i=1}^j i \right) = \sum_{j=1}^n \left( j \times \frac{j(j+1)}{2} \right) = \frac{1}{2} \left( \sum_{j=1}^n j^3 + \sum_{j=1}^n j^2 \right) \\
&= \frac{1}{2} \left( \frac{n^2(n+1)^2}{4} + \frac{n(n+1)(2n+1)}{6} \right) = \frac{3n^2(n+1)^2 + 2n(n+1)(2n+1)}{24} \\
&= \frac{n(n+1)(3n(n+1) + 2(2n+1))}{24} = \frac{n(n+1)(3n^2 + 3n + 4n + 2)}{24} \\
&= \frac{n(n+1)(3n^2 + 7n + 2)}{24}.
\end{aligned}$$

2.

$$\begin{aligned}
\sum_{1 \leq i < j \leq n} (i+j) &= \sum_{j=2}^n \left( \sum_{i=1}^{j-1} (i+j) \right) = \sum_{j=2}^n \left( \sum_{i=1}^{j-1} i + \sum_{i=1}^{j-1} j \right) = \sum_{j=2}^n \left( \frac{(j-1)j}{2} + (j-1)j \right) \\
&= \sum_{j=2}^n \frac{3(j^2 - j)}{2} = \frac{3}{2} \sum_{j=2}^n j^2 - \frac{3}{2} \sum_{j=2}^n j = \frac{3}{2} \left( \sum_{j=1}^n j^2 - 1 \right) - \frac{3}{2} \left( \sum_{j=1}^n j - 1 \right) \\
&= \frac{3}{2} \frac{n(n+1)(2n+1)}{6} - \frac{3}{2} - \frac{3}{2} \frac{n(n+1)}{2} + \frac{3}{2} = \frac{3}{2} \frac{n(n+1)((2n+1)-3)}{6} \\
&= \frac{n(n+1)(2n-2)}{4} = \frac{(n-1)n(n+1)}{2}.
\end{aligned}$$

3.

$$\sum_{0 \leq i,j \leq n} 2^{i+j} = \sum_{j=0}^n \left( \sum_{i=0}^n 2^{i+j} \right) = \sum_{j=0}^n \left( 2^j \sum_{i=0}^n 2^i \right) = \sum_{j=0}^n 2^j \frac{1 - 2^{n+1}}{1 - 2} = \frac{1 - 2^{n+1}}{-1} \frac{1 - 2^{n+1}}{-1} = (1 - 2^{n+1})^2.$$

4.

$$\begin{aligned}
\sum_{1 \leq i \leq j \leq n} \frac{i}{j} &= \sum_{j=1}^n \left( \sum_{i=1}^j \frac{i}{j} \right) = \sum_{j=1}^n \frac{1}{j} \left( \sum_{i=1}^j i \right) = \sum_{j=1}^n \frac{1}{j} \times \frac{j(j+1)}{2} = \sum_{j=1}^n \frac{j+1}{2} = \frac{1}{2} \sum_{j=1}^n j + \frac{1}{2} \sum_{j=1}^n 1 \\
&= \frac{1}{2} \times \frac{n(n+1)}{2} + \frac{1}{2} \times n = \frac{n(n+2)}{2}.
\end{aligned}$$

**Exercice 2** 1. (a) La valeur de  $S$  en sortie correspond à la valeur de la somme  $\sum_{1 \leq i,j \leq n} \min(i,j)$ .(b) On décompose  $S$  en trois sommes, en distinguant les cas où  $i < j$ ,  $i = j$  et  $i > j$ :

$$\begin{aligned}
\sum_{1 \leq i,j \leq n} \min(i,j) &= \sum_{1 \leq i < j \leq n} \min(i,j) + \sum_{1 \leq i=j \leq n} \min(i,j) + \sum_{1 \leq j < i \leq n} \min(i,j) \\
&= \sum_{1 \leq i < j \leq n} i + \sum_{1 \leq i \leq n} i + \sum_{1 \leq j < i \leq n} j.
\end{aligned}$$

(c)

$$\begin{aligned}
\sum_{1 \leq i,j \leq n} \min(i,j) &= \sum_{1 \leq i < j \leq n} i + \sum_{1 \leq i \leq n} i + \sum_{1 \leq j < i \leq n} j = 2 \sum_{1 \leq i < j \leq n} i + \sum_{1 \leq i \leq n} i \\
&= 2 \sum_{j=2}^n \left( \sum_{i=1}^{j-1} i \right) + \sum_{1 \leq i \leq n} i = 2 \sum_{j=2}^n \frac{(j-1)j}{2} + \frac{n(n+1)}{2} \\
&= \sum_{j=2}^n j^2 - \sum_{j=2}^n j + \frac{n(n+1)}{2} = \sum_{j=1}^n j^2 - 1 - \sum_{j=1}^n j + 1 + \frac{n(n+1)}{2} \\
&= \frac{n(n+1)(2n+1)}{6} - \frac{n(n+1)}{2} + \frac{n(n+1)}{2} = \frac{n(n+1)(2n+1)}{6}.
\end{aligned}$$

2. Voici la procédure pour calculer  $T_n$ :

```
n=input( 'Donner une valeur de n : ')
T=0
for i=1:n do
    for j=1:n do
        if i>j then
            T=T+i
        else
            T=T+j
        end
    end
end
disp(T)
```

3. (a) Voici la procédure pour calculer  $U_n$ :

```
n=input( 'Donner une valeur de n : ')
U=0
for i=1:n do
    for j=1:n do
        U=U+abs(i-j)
    end
end
disp(U)
```

(b)

$$\begin{aligned} \sum_{1 \leq i, j \leq n} |i - j| &= \sum_{1 \leq i < j \leq n} |i - j| + \sum_{1 \leq i \leq n} 0 + \sum_{1 \leq j < i \leq n} |i - j| = \sum_{1 \leq i < j \leq n} (j - i) + \sum_{1 \leq j < i \leq n} (i - j) \\ &= 2 \sum_{1 \leq i < j \leq n} (j - i) = 2 \sum_{j=2}^n \left( \sum_{i=1}^j (j - i) \right) = 2 \sum_{j=2}^n \left( j^2 - \frac{j(j+1)}{2} \right) = 2 \sum_{j=2}^n \frac{j^2 - j}{2} \\ &= \sum_{j=2}^n (j^2 - j) = \sum_{j=1}^n (j^2 - j) = \frac{n(n+1)(2n+1)}{6} - \frac{n(n+1)}{2} = \frac{n(n+1)((2n+1)-3)}{6} \\ &= \frac{(n-1)n(n+1)}{3}. \end{aligned}$$

---

### Exercice 3 1.

$$\sum_{1 \leq i \leq j \leq n} q^j = \sum_{j=1}^n \left( \sum_{i=1}^j q^j \right) = \sum_{j=1}^n jq^j.$$

2. Avec la formule d'interversion des indices, on a:

$$\begin{aligned} \sum_{j=1}^n jq^j &= \sum_{1 \leq i \leq j \leq n} q^j = \sum_{i=1}^n \left( \sum_{j=i}^n q^j \right) = \sum_{i=1}^n \left( \sum_{k=0}^{n-i} q^{k+i} \right) = \sum_{i=1}^n \left( q^i \sum_{k=0}^{n-i} q^k \right) = \sum_{i=1}^n \left( q^i \frac{1-q^{n-i+1}}{1-q} \right) \\ &= \sum_{i=1}^n \frac{q^i - q^{n+1}}{1-q} = \frac{1}{1-q} \left( \sum_{i=1}^n q^i - \sum_{i=1}^n q^{n+1} \right) = \frac{1}{1-q} \left( \sum_{k=0}^{n-1} q^{k+1} - \sum_{i=1}^n q^{n+1} \right) \\ &= \frac{1}{1-q} \left( q \sum_{k=0}^{n-1} q^k - \sum_{i=1}^n q^{n+1} \right) = \frac{1}{1-q} \left( q \frac{1-q^n}{1-q} - nq^{n+1} \right) \\ &= \frac{q - q^{n+1} - nq^{n+1}(1-q)}{(1-q)^2} = \frac{q - (n+1)q^{n+1} + nq^{n+2}}{(1-q)^2}. \end{aligned}$$
